

JESSE COPAS

Systems Administrator | Windows Infrastructure, Troubleshooting & Automation

Rochester, NY
JesseCopas@gmail.com
jessecopas.com
LinkedIn | GitHub: Jessomadic

PROFESSIONAL SUMMARY

Systems administrator focused on root-cause troubleshooting across Windows Server, Active Directory and Group Policy, DNS, DHCP, Hyper-V, Microsoft 365, Entra ID, Intune, RMM, and monitoring. I keep digging when an issue crosses systems or keeps coming back. Once I find the cause, I document the fix in runbooks or knowledge-base articles and train other technicians so the team can handle it next time. I also build and own internal tools, including the production ticketing system that fully replaced the legacy Perl/PHP workflow.

40%

average reduction in deployment time

75%

less manual setup time

Hours/days to seconds

large Active Directory exports

CORE CAPABILITIES

WINDOWS INFRASTRUCTURE

Windows Server administration, Active Directory, Group Policy, DNS and DHCP, Windows Server patching, File shares and permissions, Backups and restores

VIRTUALIZATION & ENDPOINT OPERATIONS

Hyper-V administration, Microsoft Intune, RMM administration, Infrastructure monitoring, Endpoint imaging and deployment, NAS administration, Server and storage hardware

IDENTITY, NETWORKING & SUPPORT

Microsoft 365 administration, Microsoft Entra ID, SonicWall, Wireless access points and network drops, Escalation ownership, Technician training and knowledge transfer

AUTOMATION & DOCUMENTATION

PowerShell, Batch, Python, JavaScript, Microsoft SQL Server, Runbooks, SOPs, and knowledge-base articles, Diagnostic tooling, AI tools and local LLM integration

TECHNICAL EXPERIENCE

Technical Engineer | Microworx

April 2024 - Present

- Built and deployed a ground-up Python, JavaScript, and Microsoft SQL Server ticketing and POS operations system integrated with the existing point-of-sale workflow. It fully replaced and retired the legacy Perl/PHP ticketing workflow. That aging IIS application on Windows Server 2008 was impossible to update or repair; the replacement preserved full backward compatibility, so all existing data remained usable in the new system.
- Own the ticketing system's full lifecycle, including authentication, backups, updates, bug fixes, feature development, deployment, and ongoing support.
- At a Microworx customer, diagnosed an RMM check-in failure that was blocking patch management and managed antivirus by writing targeted diagnostic scripts and tracing the problem to a rogue RAID-monitoring process flooding TCP traffic.
- Built a laptop battery-life benchmarking tool that automated video, audio, and office test cycles, tracked usage, generated reports, and shut systems down safely.
- Built a VSS live-imaging and delta-merging workflow that cut endpoint deployment time by 40% on average while restoring programs and data onto a fresh Windows installation instead of carrying forward corruption from the previous OS.

Hewlett-Packard Enterprise Field Technician | HEMMERSBACH US LLC

May 2023 - Nov 2023

- Owned field-service diagnoses and repairs independently from initial troubleshooting through completion.
- Diagnosed and repaired HP laptops, desktops, A3/A4 printers, servers, and storage hardware.
- Replaced components, installed server hardware, and integrated new servers into client networks.
- Handled 2-5 field-service tickets per day across routes of up to 400 miles.

Network Engineer | Simple Tech Innovations

Nov 2022 - May 2023

- Built a reusable Batch deployment workflow for non-PXE environments covering software installation, Windows configuration, browser defaults, computer naming, security-product cleanup, Windows 11 upgrades, and RMM handoff.
- Moved between remote help desk work, on-site troubleshooting, equipment repair, and new hardware deployments for an MSP client base.
- Deployed and repaired computers, printers, wireless access points, and network drops.
- Reduced manual workstation setup time by 75% through Batch deployment automation.
- Supported roughly 150 MSP clients as part of a three-person technical team.

EXPERIENCE CONTINUED

Help Desk - IT Analyst | University of Rochester Medical Center

March 2022 - Oct 2022

- Traced and resolved identity, application, and endpoint problems across Active Directory, Citrix Workspace, ServiceNow, Epic, and Windows for staff throughout University of Rochester hospitals and medical centers.
- Built a PowerShell and Windows Forms tool that recursively queried Active Directory group membership and exported user details to CSV.
- Supported staff in a healthcare environment serving 45,000 employees, 20,000 devices, and 400+ applications.
- Worked on a 15-person help desk team handling 500-1,000 calls per day.
- Reduced requests covering hundreds or thousands of Active Directory users from hours or days of manual work to a CSV generated in seconds.

SELECTED INFRASTRUCTURE CASE STUDIES

Custom Ticketing & POS Operations System

Problem: The legacy Perl/PHP system still supported the repair workflow but had become impossible to update or repair and still ran as an IIS application on Windows Server 2008. **Action:** Designed, built, and deployed the application without adapting a commercial or open-source ticketing base; preserved full backward compatibility; continue to administer authentication, backups, updates, bug fixes, and new features. **Result:** Fully replaced and retired the legacy Perl/PHP ticketing workflow and its Windows Server 2008/IIS dependency while keeping all existing data usable in the new system.

Technologies: Python, JavaScript, Microsoft SQL Server, POS Integration, Legacy System Replacement

RMM Communication Failure Investigation

Problem: RMM check-ins were failing, which blocked patch management and managed antivirus functions. **Action:** Wrote targeted diagnostic scripts and traced the failure to a rogue RAID-monitoring process flooding TCP traffic. **Result:** Identified the hidden software conflict behind a failure that initially presented as an RMM communication problem.

Technologies: Diagnostic Scripting, RMM, Windows Endpoints, TCP/IP, Monitoring

VSS Live-Imaging Workflow

Problem: The existing imaging process slowed endpoint deployment and could carry operating-system corruption into the replacement system. **Action:** Developed an in-house VSS live-imaging and delta-merging workflow that restored programs and data onto a fresh Windows installation. **Result:** Improved deployment stability by avoiding corruption carried forward from the previous Windows installation.

Technologies: VSS, Windows Deployment, Endpoint Imaging

CERTIFICATIONS & TRAINING

CompTIA A+ - CompTIA

SonicWall Network Security Administrator (SNSA) - SonicWall

3CX Basic Certified Engineer - 3CX

HP Enterprise Server Service Certification - HP

HP A3/A4 Printer Repair Certifications - HP

TRAINING

SC-300T00-A: Microsoft Identity and Access Administrator - Microsoft
